

KAN NATURLIGE ADDITIVER I FODERET VÆRE VEJEN TIL EN MERE KLIMANEUTRAL ØKO-KO?

METTE OLAF NIELSEN

MIRKA THORSTEINSSON

NATALJA NØRSKOV

MIHAI CURTASU

MARCO BATTELLI (UNIVERSITY OF MILANO, IT)

AARHUS UNIVERSITET

INSTITUT FOR HUSDYR- OG VETERINÆRVIDENSKAB

Økologikongres, 22 November 2023, Bredsten

HVORFOR ER METAN KOMMET I FOKUS I KLIMA DEBATEN ?

IPCC, 2001

CH₄ HAR IFT CO₂ MEGET STØRRE GLOBALT OPVARMNINGSPOTENTIALE (GWP)

Drivhusgas	Levetid (år)	GWP-20	GWP-100
Kuldioxid (CO ₂)	Hundredvis	1	1
Metan (CH ₄)	11.8 CH ₄ -> CO ₂ +H ₂ O	80	27

Reduktion af metan udledning: akut bidrag til "afkøling"
Indtil vi kan løse det virkelige problem: reducere CO₂

STORT METANBIDRAG FRA KVÆG

- Landbruget: Nielsen et al., 2022. Landøkonomisk Tidsskrift, 08, 2, 81-93 på basis af nationale opgørelser
 - Ansvarligt for 82% af metan udledninger i DK
 - Eller til 12.6% af total national drivhusgasudledning
- ~55% af metan fra landbrug stammer fra kvægs fordøjelse

Stort fokus på kvæg sektoren => fremtiden er alvorligt udfordret

Danish Crown

0%

Vi ser en fremtid i 2050, hvor vores kødproduktion vil være klimaneutral (netto-nul)

HVORFOR LAVER KØER
METAN ?

--- DET GØR DE FAKTISK HELLER IKKE !

Fordøjelse og forgæring udført af vom mikrobiota

Foder → Kortkædede fedtsyrer
→ Mikrobielt protein

→ Kan absorberes

Archaea (metanogener)

En malkeko producere op til
600-700 l metan per dag

HVAD ER DET VI GERNE VIL PÅ KO NIVEAU?

Fra bakteriel forgæring i vommen

Arkæer's metanogenese

Opsamling fra
stald -> CO2 

Eksisterende foderadditiver:

- Bovaer (>30%)
- Nitrat (max 15-20%)

Foder sammensætning:

-  - Skift: fibre -> stivelse (5%)
-  - Fedt (max 8%)
-  Avl: ??? (LAAANG tid)

Can producing and consuming more algae make a significant contribution to the achievement of our climate goals?

Særlige rødalger:
Hæmmer metan

Visse alge arter:
Protein rige
Let nedbrydelige

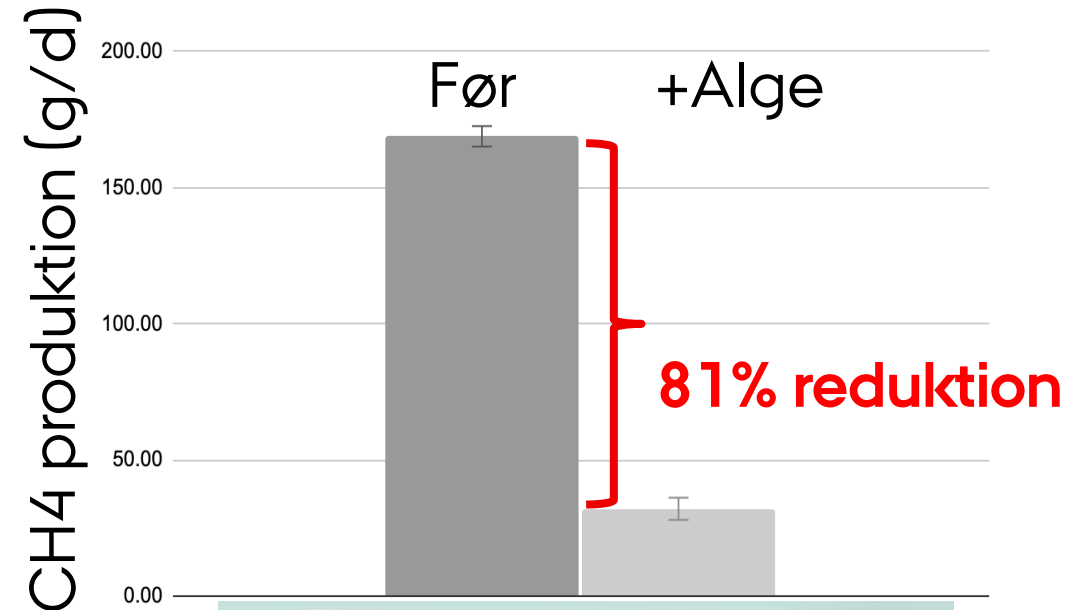

ALGER ER TILLADTE FODERMIDLER - OGSÅ I ØKOLOGISK PRODUKTION !

Test i Sverige

17 tyrekalve i 13 dage

Asparagopsis (dyrket på land)

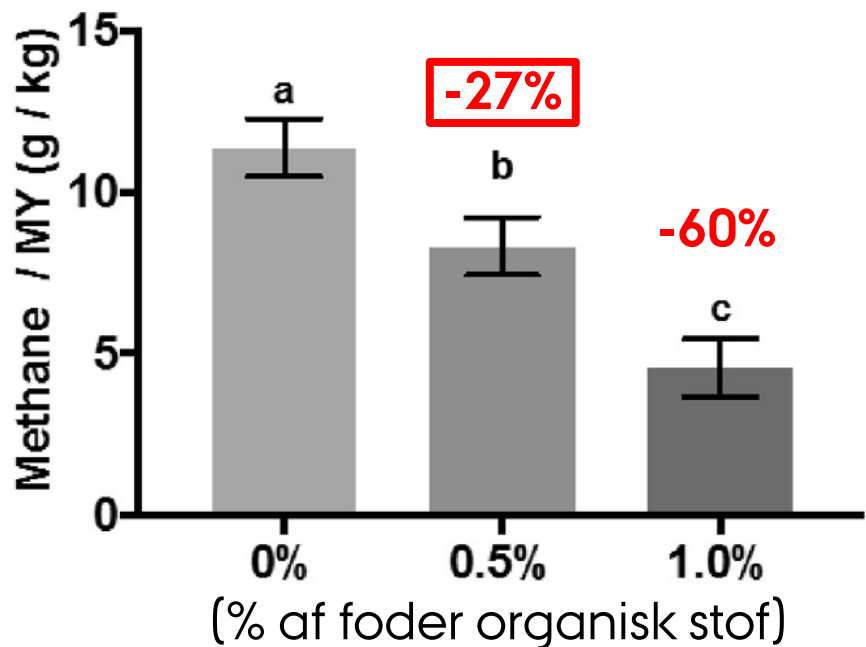

0.6% i foderet (tørstof basis)

LOME: LOw MEthane kød

TROPISK RØDALGE: *ASPARAGOPSIS ARMATA* - KØER

Behandlingsgruppe	Kontrol	Lav	Høj
<i>Asparagopsis</i> i tørstof	0%	0.5%	1.0%
Tørstofindtag, kg	27.9	24.9	17.3 (-38%)
Mælkeydelse, kg/d	36.2	37.2	32.0 (-12%)
Bromoform, yg/L mælk	0.11	0.15	0.15

Halometaner:

- Ozon nedbrydende
- Kræft fremkaldende

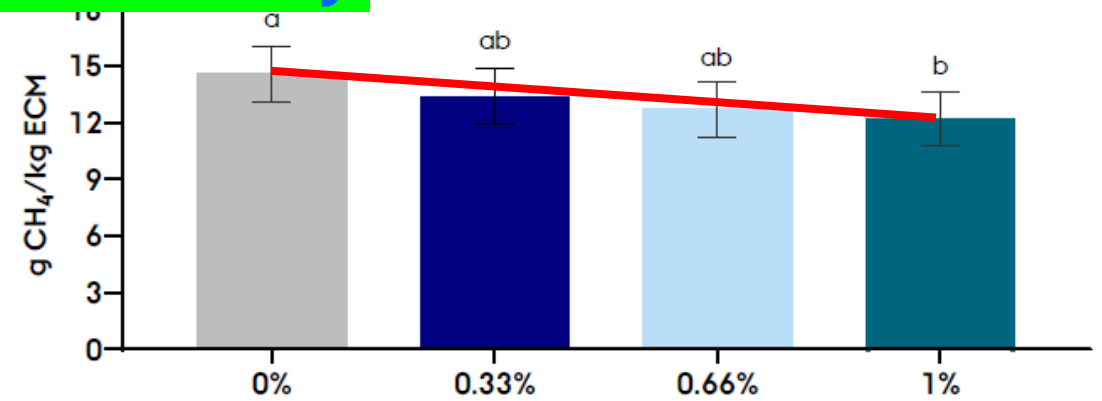

BONNEMAISONIA HAMIFERA (RØDTOT)

CH₄ per kg tørstof indtag

CH₄ per kg EKM

- Lineært fald i metan ~20%
- Ingen effekt på mælkeydelse
- Ingen effekt på tørstofindtag

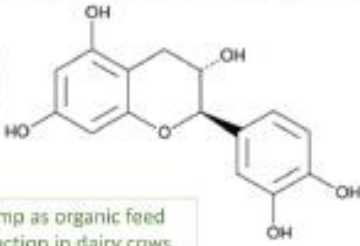

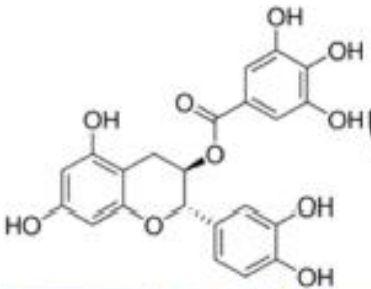

% alge i fodertørstof

Tannins of willow and hemp as organic feed additive for methane reduction in dairy cows

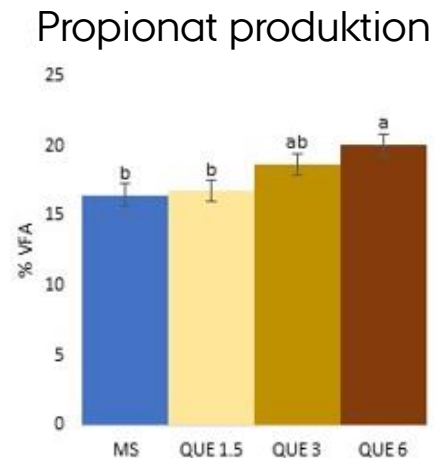

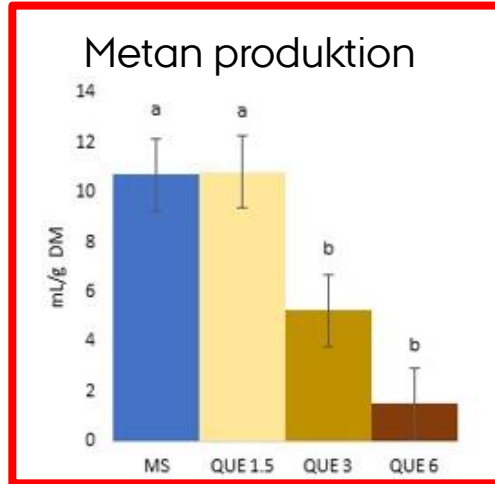

The central graphic is a composite image. At the top center, the text "ECOCO2W" is written in green. To the left is a chemical structure of a tannin derivative, showing a central pyrogallol unit linked to two gallic acid units. In the center is a black and white illustration of a cow's head. To the right is a photograph of tall green hemp plants against a blue sky. Below the cow illustration is another chemical structure, similar to the one on the left but with a different linkage. At the bottom left is a photograph of willow plants in a field under a cloudy sky. At the bottom center, a white box contains the text: "Tannins of willow and hemp as organic feed additive for methane reduction in dairy cows".

DER FINDES BIOAKTIVE METABOLITTER I MANGE TERRESTRISKE PLANTER

Man har fundet > 5000 plante sekundære metabolitter (PSM)

QUERCITIN (FINDES I PIL OG HAMP)

OPSUMMERING – HVAD KAN GØRES NU ?

Foderskift: op til ~10% reduktion

HAR VI POTENTIET NYE VIRKEMIDLER ?

JA: Tang - er allerede godkendte fodermidler

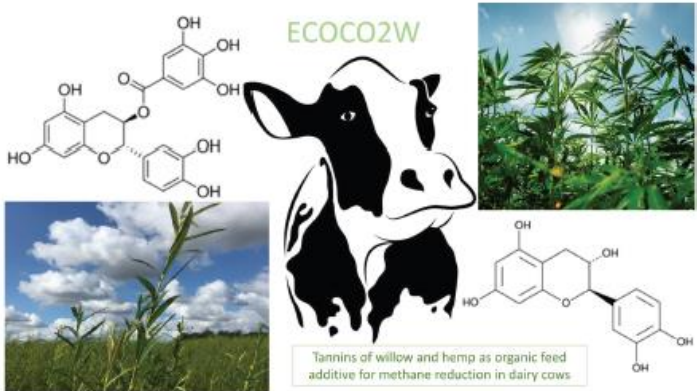

- (Tropiske) rødalger
- Bioaktive stoffer inkluderer halometaner 
- Men nogen arter mere end andre
- Metan reduktion: køer ~30% ?, gold-/ungdyr ~50-80% ?
- Issue: opskalering af produktion (land-baseret; invasive arter)

MÅSKE: Plante bioaktive metabolitter -  ?
